Table of contents

1. PDB database

The main repository of biomolecular structior data is called the pdb found at: https://www.rcsb.org/

Let's see what this database contains. PDB analyze >PDB statistics > by Experimental Method and Molecular Type

```
pdbstats <- read.csv("Data Export Summary.csv")
pdbstats
```

```
           Molecular.Type   X.ray     EM    NMR Multiple.methods Neutron Other
1          Protein (only) 169,563 16,774 12,578              208      81    32
2 Protein/Oligosaccharide   9,939  2,839     34                8       2     0
3              Protein/NA   8,801  5,062    286                7       0     0
4     Nucleic acid (only)   2,890    151  1,521               14       3     1
5                   Other     170     10     33                0       0     0
6  Oligosaccharide (only)      11      0      6                1       0     4
    Total
1 199,236
2  12,822
3  14,156
4   4,580
```

```
5     213
6      22
```

commas result in numerical values being categorized as a character

```
pdbstats$X.ray
```

```
[1] "169,563" "9,939"   "8,801"   "2,890"   "170"     "11"
```

This can be fixed by replacing "," for nothing " " with `sub()` function:

```
x <- pdbstats$X.ray
x_numeric <- as.numeric( gsub(",", "", x))
x_numeric
```

```
[1] 169563   9939   8801   2890    170     11
```

or I can use the **readr** package and the `read_csv()` function

```
library(readr)
pdbstats <- read_csv("Data Export Summary.csv", show_col_types = FALSE)
pdbstats
```

```
# A tibble: 6 x 8

> Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

2,298 structures are currently in the pdb.

2. Using mol*

The main mol* homepage: https://molstar.org/viewer/ We can input our own PDB files or just give it a PDB database accession code (4 letter PDB code)

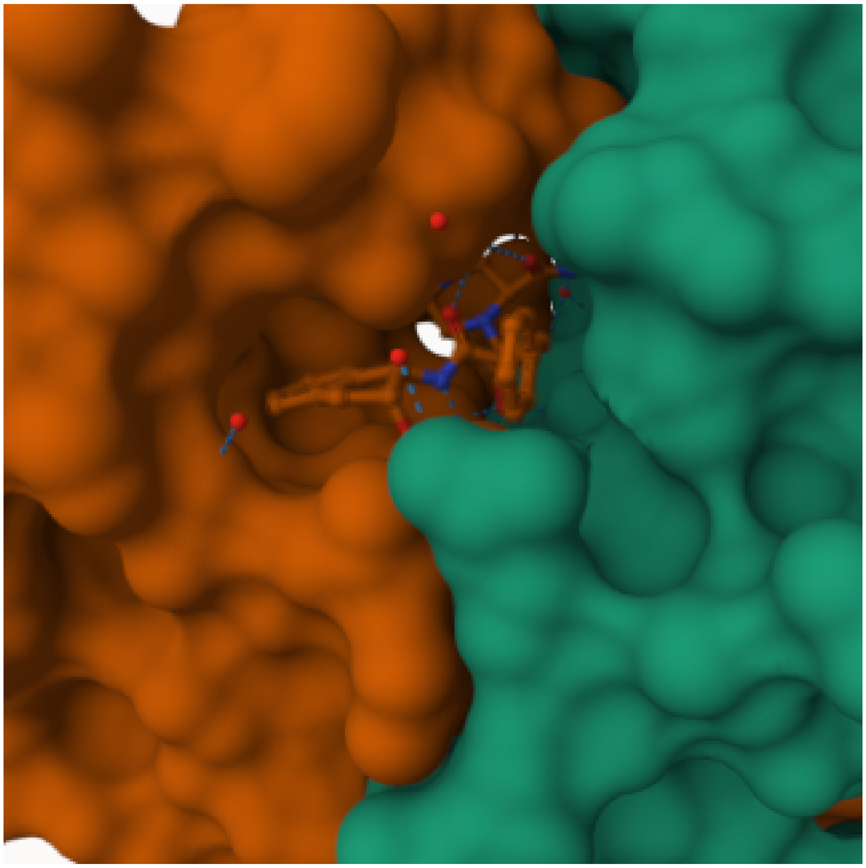

Figure 1: Molecular View of 1HSG

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

This is due to the limitation of detection of water molecules. Hydrogen molecules are harder to detect while oxygen molecules aren't. The one atom shown is oxygen and has a higher accuracy of position. Another reason this is beneficial is it simplifies visualizing the structure.

Q5. There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

306

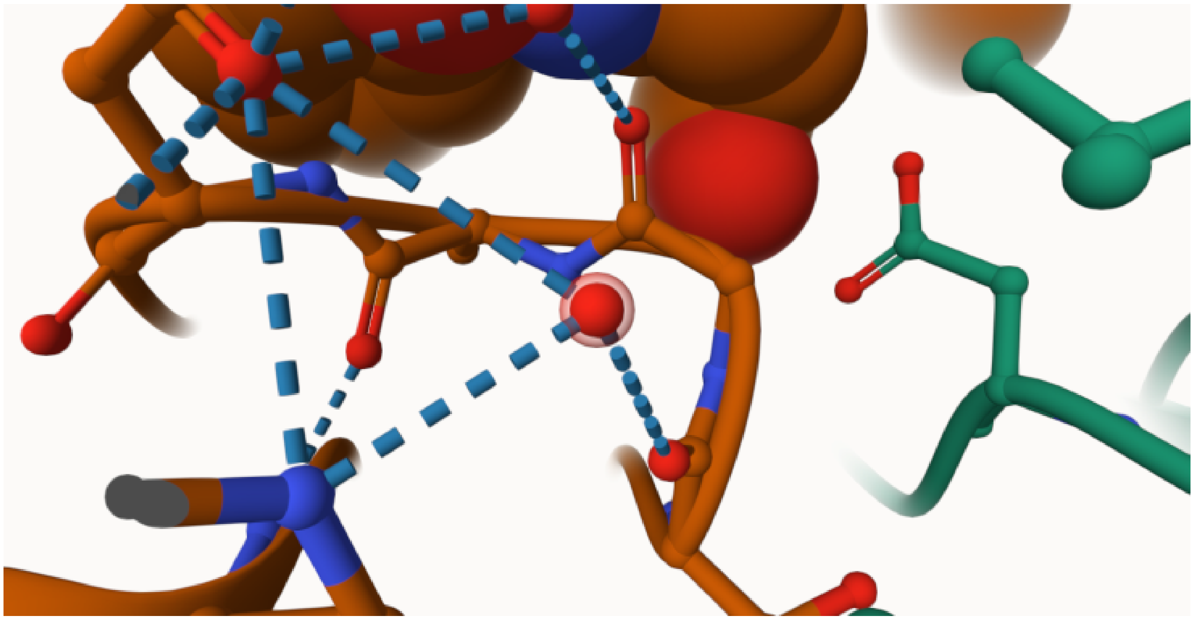

Figure 2: Conserved Water Molecule

Q6. Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand.

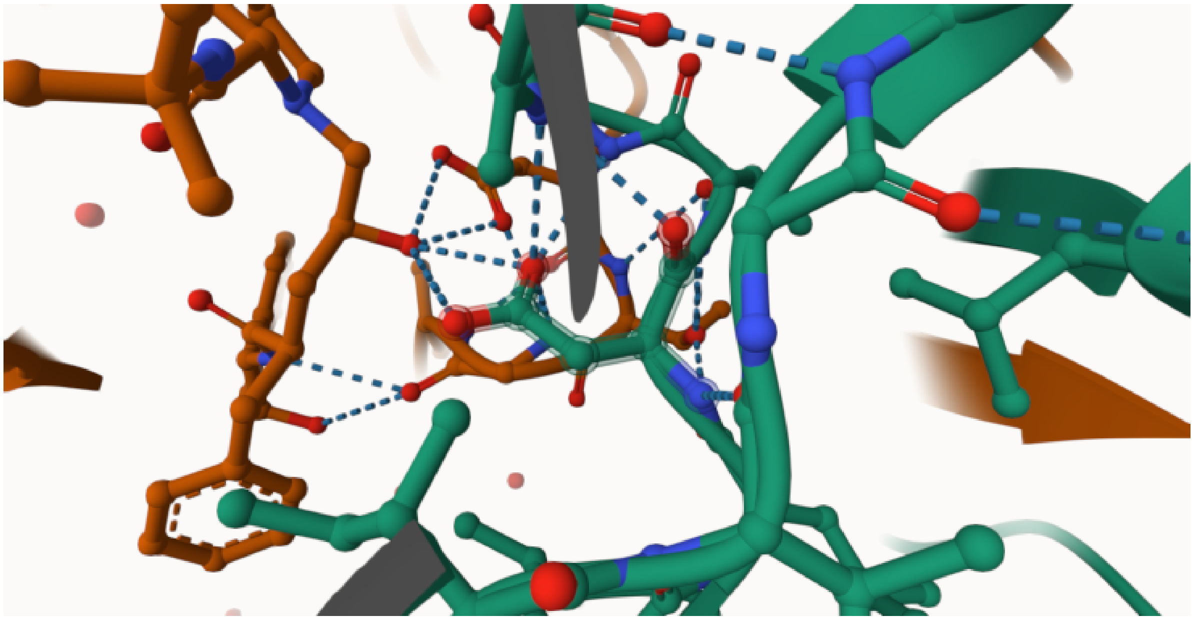

Figure 3: aspartic acid interaction with ligand

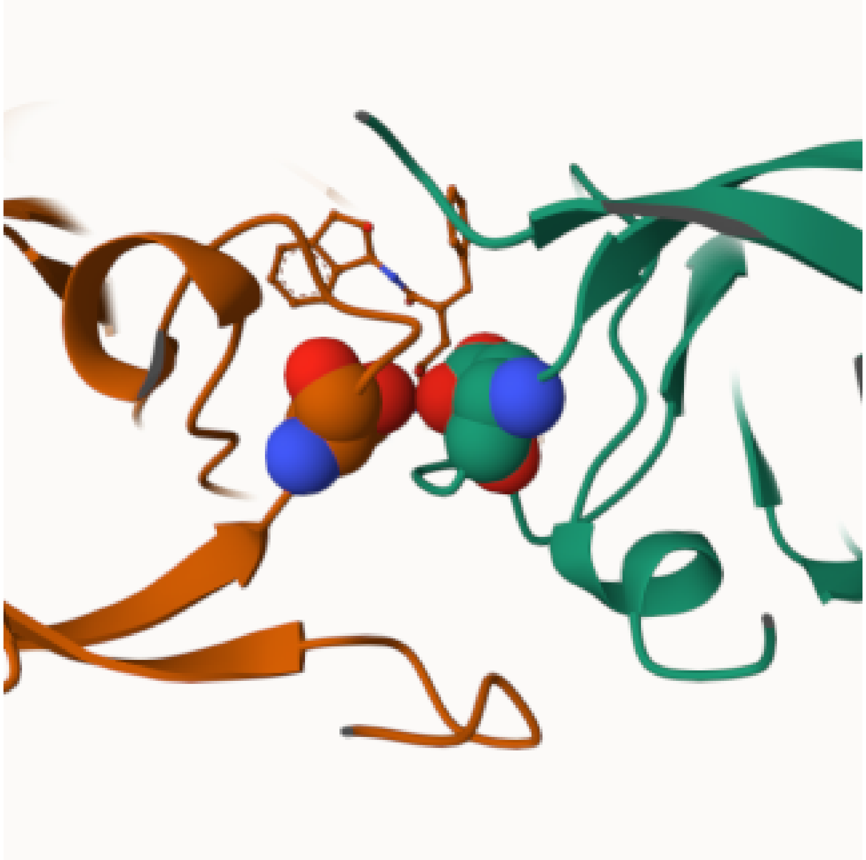

Figure 4: Aspartic Acid 25

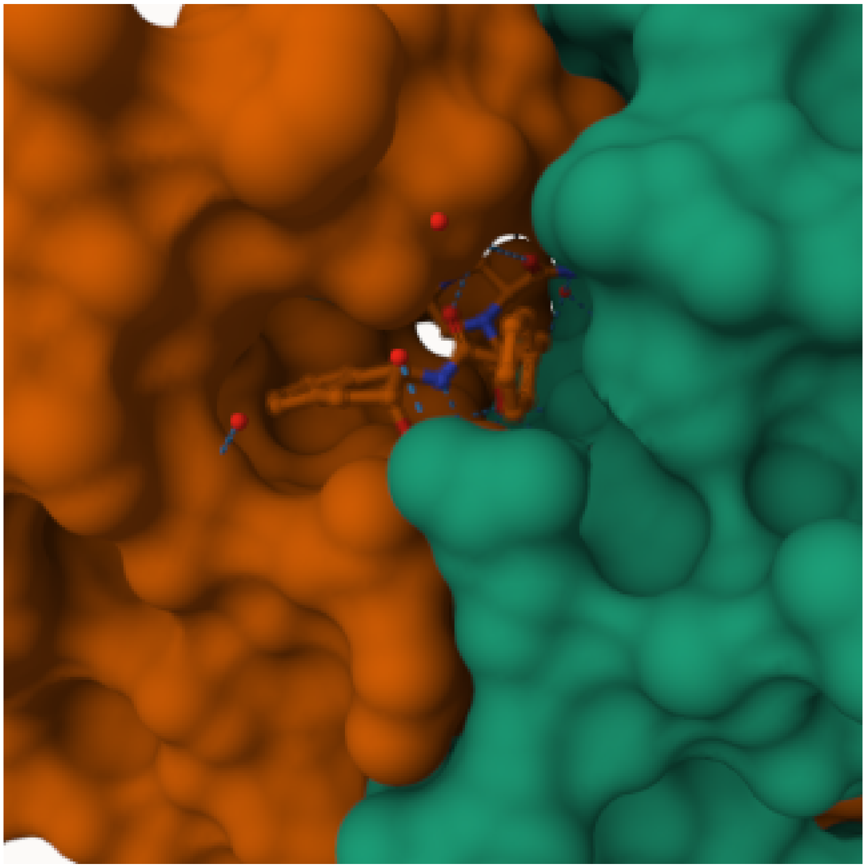

Figure 5: Molecular View of 1HSG

3. Introduction to Bio3D in R

Bio3D can be used to read PDB data in R

```
library(bio3d)

pdb <- read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")
```

```
   Total Models#: 1
     Total Atoms#: 1686,  XYZs#: 5058  Chains#: 2  (values: A B)

     Protein Atoms#: 1514  (residues/Calpha atoms#: 198)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

+ attr: atom, xyz, seqres, helix, sheet,
        calpha, remark, call
```

Q7. How many amino acid residues are there in this pdb object?

```
length( pdbseq(pdb))
```

```
[1] 198
```

Q8. Name one of the two non-protein residues?

MK1

9. How many protein chains are in this structure?

2 chains, A and B

Looking in more detail of `pdb`

```
attributes(pdb)
```

```

```

4. predicting functional dynamics

We can use the `nma()` function in bio3d to predict the large-scale functional motions of biomolecules

```r
adk <- read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
```

```r
adk
```

```
 Call:  read.pdb(file = "6s36")

   Total Models#: 1
     Total Atoms#: 1898,  XYZs#: 5694  Chains#: 1  (values: A)

     Protein Atoms#: 1654  (residues/Calpha atoms#: 214)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 244  (residues: 244)
     Non-protein/nucleic resid values: [ CL (3), HOH (238), MG (2), NA (1) ]
